

Q1. Difference Between Tableau Dashboard and Tableau Story Point

Tableau Dashboard	Tableau Story Point
Combines multiple worksheets into a single interactive screen.	Presents data insights in a sequence of slides/pages.
Used for monitoring and exploration.	Used for storytelling and presenting findings.
Users interact with filters and actions.	Users follow a guided narrative.

Healthcare Use Cases

Dashboard:

1. Monitor patient admissions, treatment costs, and department performance.
2. Track hospital KPIs such as recovery rate and bed occupancy.

Story Point:

1. Present patient distribution across regions and explain trends.
2. Show treatment cost trends over time and conclude with outcome analysis.

Q2. What are Actions in Tableau? Explain how filter can help hospital management analyze patient data

Actions allow users to interact with visualizations.

Types:

- Filter Action
- Highlight Action
- URL Action

How Filter Action Helps Hospital Management

Example:

- A dashboard shows Hospital Region and Department Performance.
- When management clicks North Region, all charts automatically display data only for North Region patients.

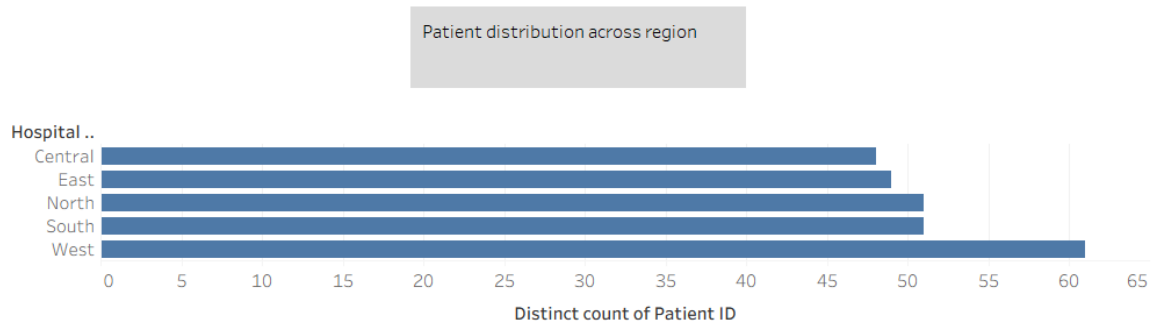

Benefits:

- Faster analysis
- Better decision-making
- Easy identification of regional issues

Q3. Patient distribution Create a bar chart showing

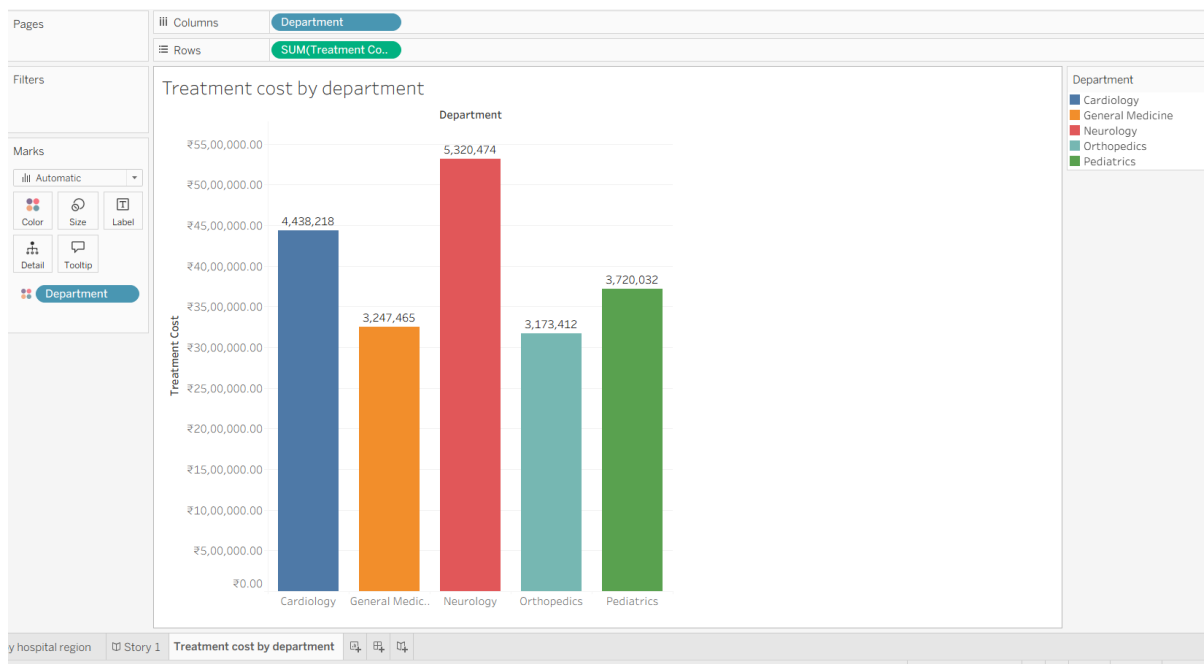

- ➔ Total Patient By hospital region
- ➔ Add this to a story point with proper title

Story 1

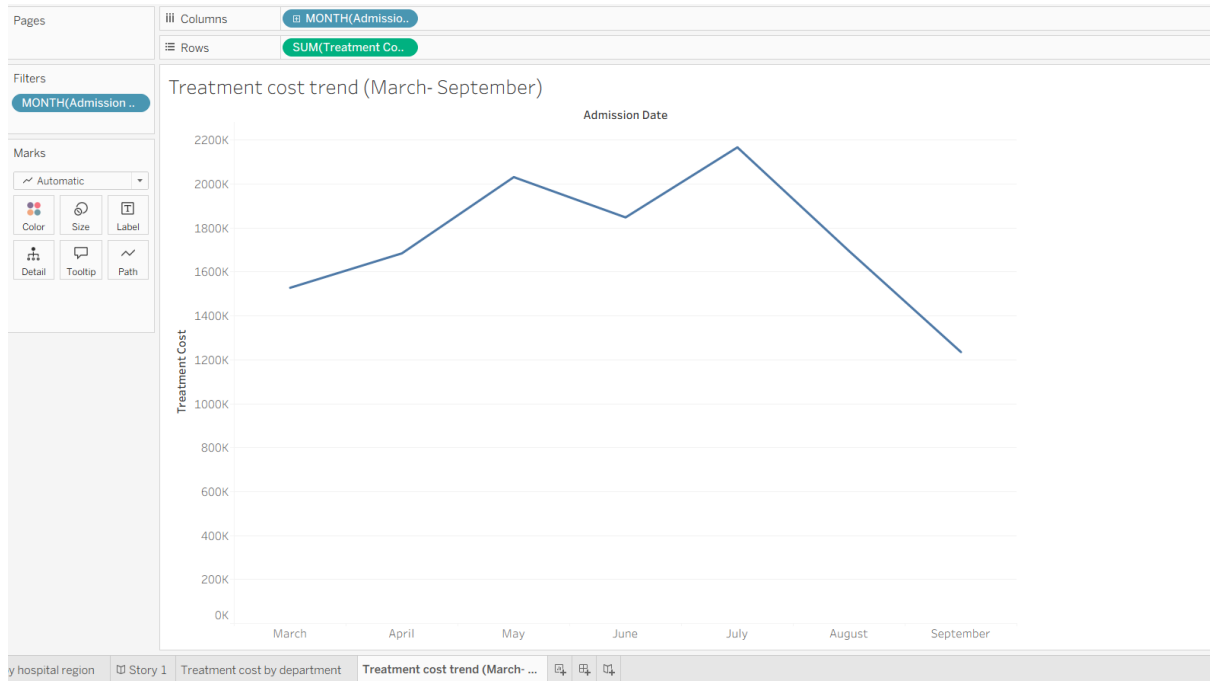

Q4. Department Performance create a visualization showing

- ➔ Treatment cost by department
- ➔ Add labels and customize colours

Q5 Treatment trend overtime create line chart

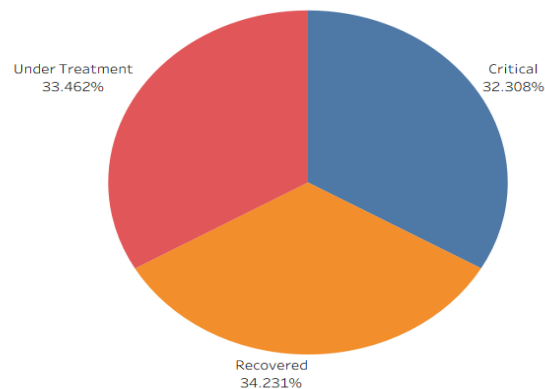

- ➔ Treatment cost VS admission date
- ➔ Filter data only from march to September

Q6 Outcome Analysis create a pie chart

- ➔ Patient outcome distribution

Patient outcome distribution

Treatment cost by department	Treatment cost trend (March- S...	Patient outcome distribution			
------------------------------	-----------------------------------	------------------------------	--	--	--

Q7 Doctor Performance & patient KPI analysis

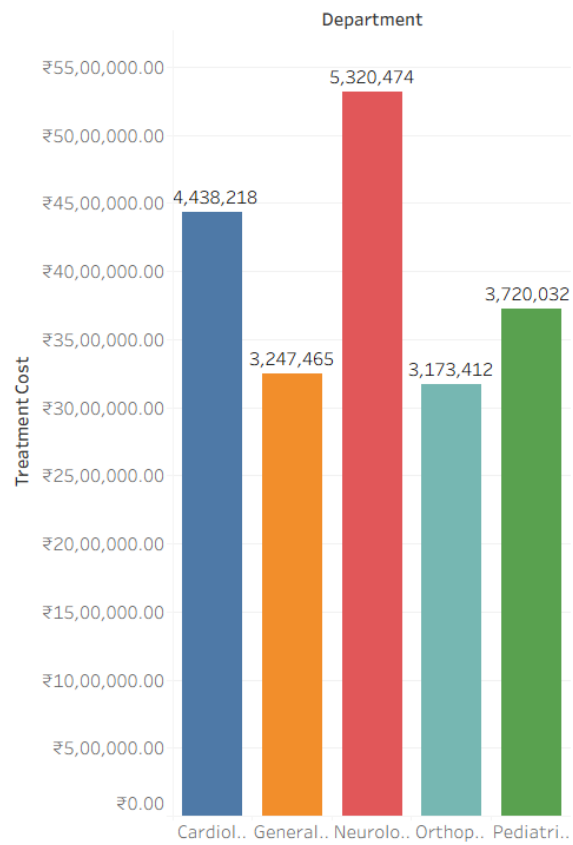

Total patient treated

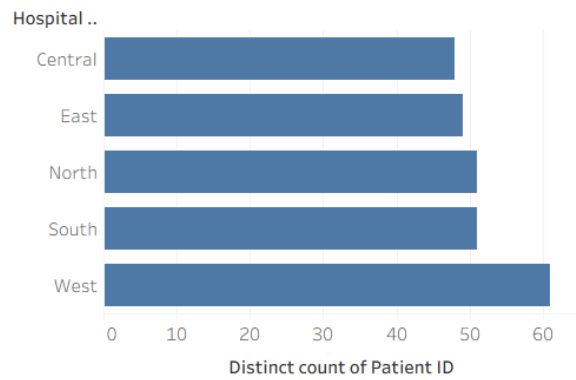

260

8.Interactive dashboard

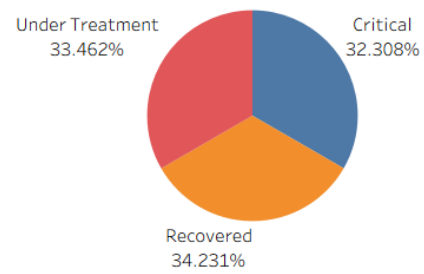

Treatment cost by department

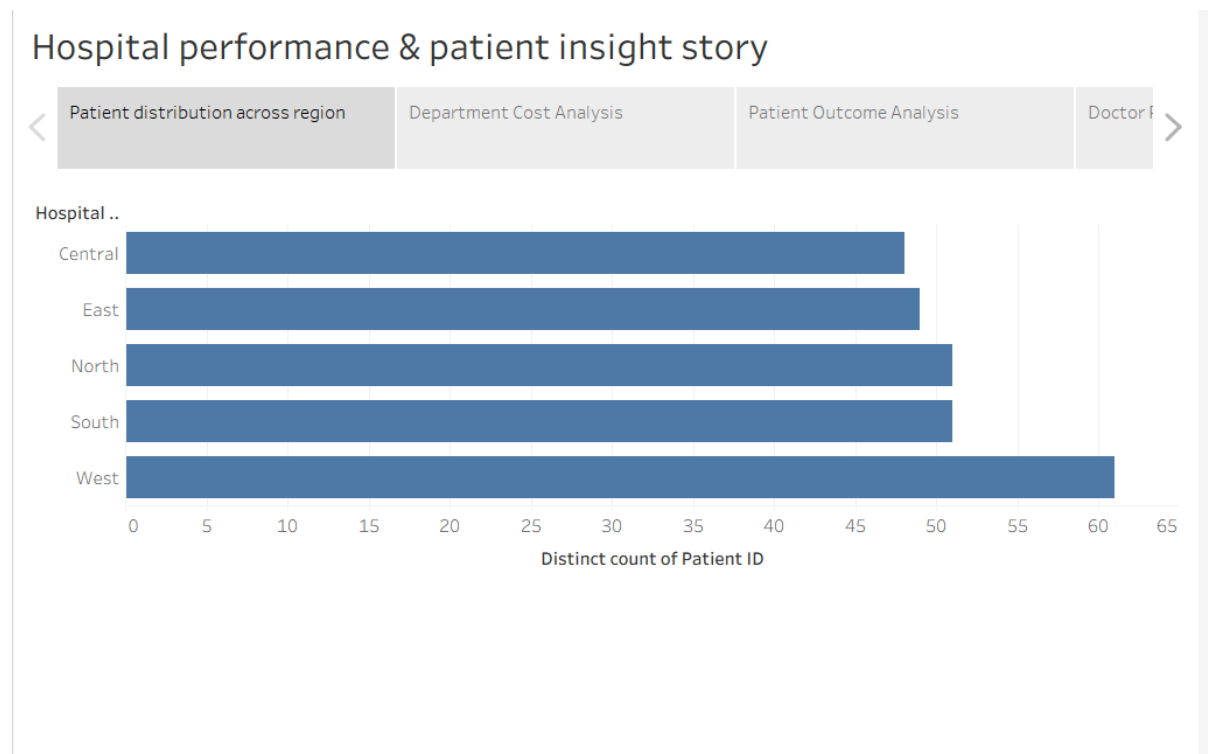

Total Patient by hospital region

Patient outcome distribution

9. Storytelling flow

Q10. Based on visuals

1. Which department generates the highest treatment cost?

→ Neurology generates the highest treatment cost, with a total treatment cost of ₹5,320,473.65.

2. Which region has more critical patients?

From the dataset, the West Region has the highest number of critical patients (20 patients). The South Region also has 20 critical patients, resulting in a tie.

Answer: The West and South regions have the highest number of critical patients, with 20 critical patients each.

3. What business decisions can hospital management take?

Based on the analysis, hospital management can:

- Allocate more resources to Neurology, since it generates the highest treatment cost.
- Increase staffing and critical-care facilities in West and South regions, where critical patient counts are highest.
- Monitor high-cost treatments to optimize expenses and improve efficiency.
- Support top-performing doctors and balance workloads across departments.
- Improve patient recovery programs to reduce the number of critical cases.

- Plan budgets and equipment purchases based on department-wise treatment costs and regional demand.

Conclusion: Focus investment on high-cost departments (Neurology) and strengthen critical-care services in the West and South regions to improve patient outcomes and operational efficiency.
