

1. What is the key difference between publishing a dashboard on Tableau Public versus Tableau Server/Cloud in terms of accessibility and data security?

Tableau Public	Tableau Server/Cloud
Dashboards are publicly accessible to anyone on the internet.	Access can be restricted to authorized users only.
No strong data security; published content is visible publicly.	Provides authentication, permissions, and security controls.
Suitable for portfolios and public reports.	Suitable for business and confidential data.

Key Difference: Tableau Public is open to everyone, while Tableau Server/Cloud offers controlled access and enterprise-level security.

2. When publishing a Tableau dashboard, what happens to a live connection compared to an extract? How does this affect data refresh and performance?

Live Connection	Extract
Queries the source database in real time.	Uses a snapshot of data stored in Tableau.
Always shows the latest data.	Requires scheduled refreshes to update data.
Performance depends on the source database speed.	Usually faster because data is optimized and stored locally.

Impact:

- **Live Connection:** Real-time data but may be slower.
- **Extract:** Faster performance but data may not be current until refreshed.

3. In Tableau Server or Cloud, which feature allows administrators to control which users can view, interact with, or edit a published dashboard?

Permissions and User Roles

Administrators use:

- Permissions
- Groups
- Site Roles

to control who can:

- View dashboards
- Interact with dashboards
- Edit workbooks
- Download data

4. If you want users to view a dashboard but not download the underlying data, which permission setting would you adjust in Tableau Server?

Adjust the **Download Data** permission.

Set:

- **View = Allowed**
- **Download Data = Denied**

This lets users see and interact with the dashboard while preventing access to underlying data.

5. Name two methods by which a Tableau dashboard can be embedded into a web page or website.

1. **Embed Code (iframe)**
 - Tableau provides HTML embed code that can be inserted into a webpage.
2. **Tableau JavaScript Embedding API**
 - Allows interactive embedding with customization and integration into websites.

6. List two best practices you should follow when preparing a dashboard for public sharing to ensure data security and privacy.

1. **Remove confidential or personally identifiable information (PII)** before publishing.
 - Examples: phone numbers, email addresses, customer IDs.
2. **Use aggregated data instead of detailed records** whenever possible.
 - Show summaries rather than individual transactions.

Additional good practices:

- Hide unused fields.
- Verify permissions.
- Remove sensitive filters and calculations.

7. After publishing a dashboard, users report a “Data not found” error. What is the most common cause related to data source settings?

Most common cause: Broken or incorrect data source connection.

Examples:

- The database server location changed.
- Credentials were not embedded.
- File path is invalid.
- The data source was moved or deleted.

Check the **data source connection settings and credentials** after publishing.

8. When embedding a Tableau dashboard into a secure internal portal, what two additional security measures should be implemented to ensure only authorized users can access the embedded content?

1. **User Authentication (SSO/SAML/OAuth)**
 - Require users to log in before accessing the dashboard.
2. **Role-Based Permissions**
 - Configure Tableau permissions so only authorized users or groups can view the dashboard.

These measures ensure that even if the dashboard is embedded, only approved users can access the content.
